## 2
```

Test the transformation for outcome variables

```
## pdf
## 2
```

No transformations improved the distribution. Original data were used.

By plotting our the pairwise correlation between variables, there is apparent linearity among the three scores. Other correlation coefficients are relatively small, indicating weak linear relationship between the variables.

##
## Residual standard error: 13.52 on 564 degrees of freedom
## Multiple R-squared: 0.3221, Adjusted R-squared: 0.2956
## F-statistic: 12.18 on 22 and 564 DF, p-value: < 2.2e-16
```

Coefficients and Significance Levels:

- Intercept (44.1006): The expected value of math_score when all other predictors are at their reference level or zero.
- gendermale (5.0855, p < 0.001): Being male is associated with an average increase of 5.0855 points in math—score compared to females, holding all else constant. This is statistically significant.
- ethnic_group: Only ethnic_groupgroup E (11.1752, p < 0.001) is significant, suggesting students in this group score higher in math compared to the reference group.
- parent_educ: The associate's degree (4.9058, p = 0.00584), bachelor's degree (6.6652, p = 0.00140), and master's degree (6.8096, p = 0.00760) are significant and associated with higher math scores compared to the reference category.
- lunch typestandard (12.3539, p < 0.001): Students with standard lunch type score significantly higher.
- test_prepnone (-4.7717, p < 0.001): Not participating in test preparation is associated with lower math scores.
- parent_marital_status: Married (5.4805, p = 0.00075) and Widowed (7.7944, p = 0.04134) are associated with higher scores.
- practice sport: Not significant.
- is first childyes: Not significant.
- nr siblings (0.7403, p = 0.05461): A borderline significant positive association with math scores.
- transport_meansschool_bus: Not significant.
- wkly_study_hours: Studying 5-10 hours (3.5394, p = 0.00863) shows a significant positive effect.

Residuals:

The spread of residuals suggests the errors are somewhat symmetrically distributed around the predicted values, which is a good sign for linear regression assumptions.

Model Fit:

Residual Standard Error (13.52): Indicates the average difference between the observed values and the values predicted by the model.

R-squared:

- Multiple R-squared (0.3221): About 32.21% of the variability in math_score is explained by the model.
- Adjusted R-squared (0.2956): Adjusts the R-squared for the number of predictors, a better measure for models with multiple predictors.

Statistic & p-value

F-statistic (12.18) and p-value (< 2.2e-16): The model is statistically significant, meaning it performs better than a model with no predictors.

## Multiple R-squared: 0.2709, Adjusted R-squared: 0.2425
## F-statistic: 9.527 on 22 and 564 DF, p-value: < 2.2e-16</pre>
```

Coefficients and Significance Levels:

- Intercept (60.8028): The expected value of reading_score when all other predictors are at their reference level or zero.
- **gendermale** (-7.6725, p < 0.001): Being male is associated with an average decrease of 7.6725 points in reading_score compared to females, holding all else constant. This is statistically significant.
- ethnic_group: Only ethnic_groupgroup E (5.9165, p = 0.013402) is significant, suggesting students in this group score higher in reading compared to the reference group.
- parent_educ: The associate's degree (4.7948, p = 0.005776), bachelor's degree (7.3496, p = 0.000313), and master's degree (8.7149, p = 0.000479) are significant and associated with higher reading scores compared to the reference category.
- lunch_typestandard (8.4374, p < 0.001): Students with standard lunch type score significantly higher.
- test_prepnone (-6.2822, p < 0.001): Not participating in test preparation is associated with lower reading scores.
- $parent_marital_statusmarried$ (5.2439, p = 0.000950): Children of married parents score higher.
- practice_sport: Not significant.
- is_first_childyes: Not significant.
- $nr_siblings (0.3882, p = 0.301309)$: No significant association with reading scores.
- transport_meansschool_bus: Not significant.
- wkly_study_hours: Studying 5-10 hours (2.6835, p = 0.041104) shows a significant positive effect.

Residuals:

The spread of residuals suggests the errors are somewhat symmetrically distributed around the predicted values, which is a good sign for linear regression assumptions.

Model Fit:

• Residual Standard Error (13.2): Indicates the average difference between the observed values and the values predicted by the model.

R-squared:

- Multiple R-squared (0.2709): About 27.09% of the variability in reading_score is explained by the model.
- Adjusted R-squared (0.2425): Adjusts the R-squared for the number of predictors, a better measure for models with multiple predictors.

Statistic & p-value

• F-statistic (9.527) and p-value (< 2.2e-16): The model is statistically significant, meaning it performs better than a model with no predictors.

## Residual standard error: 12.65 on 564 degrees of freedom
## Multiple R-squared: 0.3634, Adjusted R-squared: 0.3385
## F-statistic: 14.63 on 22 and 564 DF, p-value: < 2.2e-16
```

Coefficients and Significance Levels:

- Intercept (57.808758): The expected value of writing_score when all other predictors are at their reference level or zero.
- gendermale (-9.268845, p < 0.001): Being male is associated with an average decrease of 9.268845 points in writing_score compared to females, holding all else constant. This is statistically significant.
- ethnic_group: ethnic_groupgroup D (5.010576, p = 0.016531) and ethnic_groupgroup E (6.018419, p = 0.008673) are significant, suggesting students in these groups score higher in writing

- compared to the reference group.
- parent_educ: associate's degree (6.130783, p = 0.000239), some college (4.338798, p = 0.010898), bachelor's degree (9.217680, p = 2.62e-06), and master's degree (11.712279, p = 1.10e-06) are significant and associated with higher writing scores compared to the reference category.
- lunch_typestandard (9.390698, p < 0.001): Students with standard lunch type score significantly higher.
- test_prepnone (-8.754351, p < 0.001): Not participating in test preparation is associated with lower writing scores.
- $parent_marital_statusmarried$ (5.246610, p = 0.000561): Children of married parents score higher.
- practice_sport: Not significant.
- is_first_childyes: Not significant.
- $nr_siblings$ (0.546033, p = 0.129340): No significant association with writing scores.
- transport_meansschool_bus: Not significant.
- wkly_study_hours: Studying 5-10 hours (2.802323, p = 0.026048) shows a significant positive effect.

Residuals:

The spread of residuals suggests the errors are somewhat symmetrically distributed around the predicted values, which is a good sign for linear regression assumptions.

Model Fit:

• Residual Standard Error (12.65): Indicates the average difference between the observed values and the values predicted by the model.

R-squared:

- Multiple R-squared (0.3634): About 36.34% of the variability in writing_score is explained by the model.
- Adjusted R-squared (0.3385): Adjusts the R-squared for the number of predictors, a better measure for models with multiple predictors.

Statistic & p-value

• F-statistic (14.63) and p-value (< 2.2e-16): The model is statistically significant, meaning it performs better than a model with no predictors.

```

With manual elimination, the model we obtained was Math Score \sim Gender + Ethnic Group + Parent Education + Lunch Type + Test Prep + Weekly Study Hours.

When using the single-function method, the model obtained with the lowest AIC was Math Score \sim Gender + Ethnic Group + Parent Education + Lunch Type + Test Prep + Number of Siblings + Weekly Study Hours. Both models' MSE are equal to each other, while the manually derived model had allower adjusted R-squared value by ~ 0.3 units.

```

With manual elimination, the model we obtained was Reading Score \sim Gender + Ethnic Group + Parent Education + Lunch Type + Test Prep.

When using the single-function method, the model obtained with the lowest AIC was Reading Score \sim Gender + Ethnic Group + Parent Education + Lunch Type + Test Prep. The one-function model had equal adjusted R-squared and MSE values.

## F-statistic: 46.18 on 6 and 580 DF, p-value: < 2.2e-16
## [1] 163.3575
```

With manual elimination, the model we obtained was Writing Score \sim Gender + Ethnic Group + Parent Education + Lunch Type + Test Prep.

When using the single-function method, the model obtained with the lowest AIC was Writing Score \sim Gender + Ethnic Group + Parent Education + Lunch Type + Test Prep + Weekly Study Hours. Both models had equal adjusted R-squared values and MSEs within 0.6 points of each other.

Step-wise: Forward Elimination

Math Score

```

The model we obtained is Math Score \sim Lunch Type + Ethnic Group + Test Prep + Gender + Parent Education + Weekly Study Hours.

When using the single-function method, the model obtained with the lowest AIC was Math Score \sim Lunch Type + Ethnic Group + Test Prep + Gender + Parent Education + Weekly Study Hours + Number of Siblings. This method resulted in a model that had a slightly lower MSE by a difference of about 1 point and approximately the same adjusted R-squared values (difference of < 0.3 units).

The model we obtained is Reading Score \sim Lunch Type + Gender + Test Prep + Parent Education + Ethnic Group.

When using the single-function method, the model obtained with the lowest AIC was Reading Score \sim Lunch Type + Gender + Test Prep + Parent Education + Ethnic Group. Both models have equal MSE and adjusted R-squared values.

The model we obtained is Writing Score \sim Lunch Type + Ethnic Group + Test Prep + Gender + Parent Education + Weekly Study Hours.

When using the single-function method, the model obtained with the lowest AIC was Writing Score \sim Gender + Lunch Type + Test Prep + Parent Education + Ethnic Group + Weekly Study Hours. Both models had approximately equal adjusted R-squared values, while the MSE of the one-line model was about 3.5 units lower.

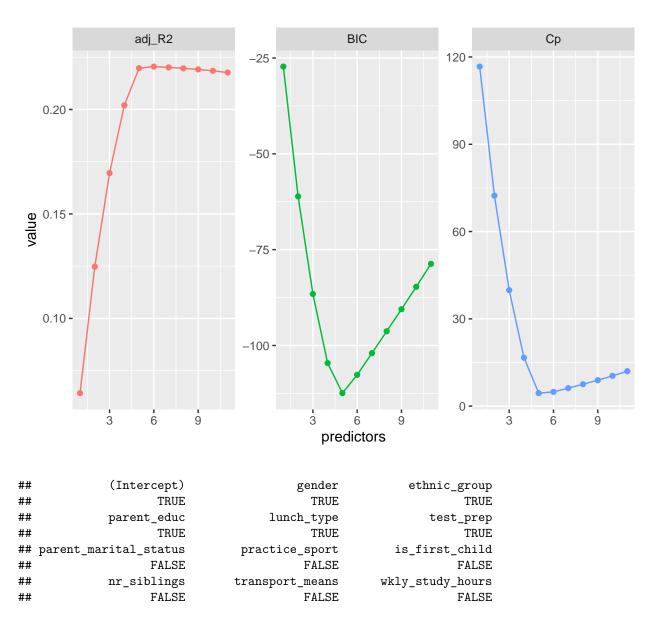

Criteria-based approach - Adjusted R^2, Cp, BIC

(Note: BIC has a larger penalty, leading to less predictors present within the model.) Math Score

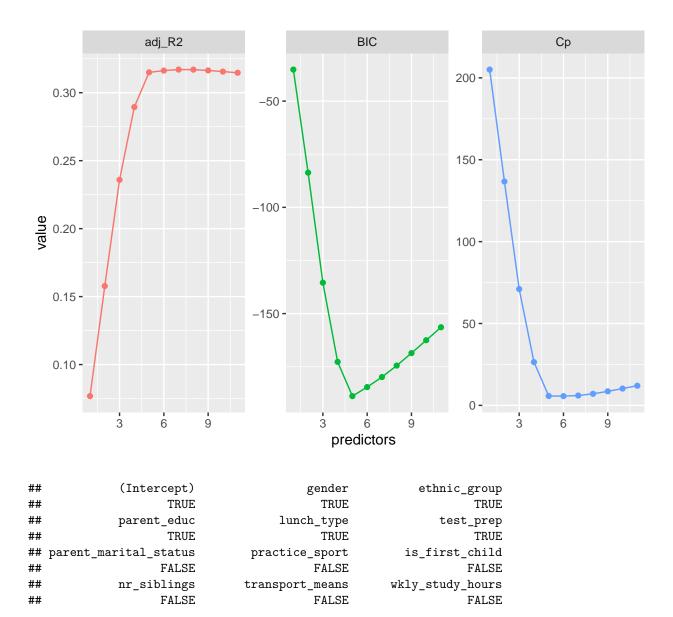

To predict math score, the adjusted R^2 statistic, Cp, and BIC plots in combination show that a 7-variable model is optimal. The predictors selected are: gender, ethnic_group, parent_educ, lunch_type, test_prep, nr_siblings, and wkly study_hours.

Reading Score

To predict reading score, the adjusted R^2 statistic and Cp and BIC plots shows that a 5-variable model is optimal. The predictors selected are: gender, ethnic_group, parent_educ, lunch_type, test_prep.

Writing Score

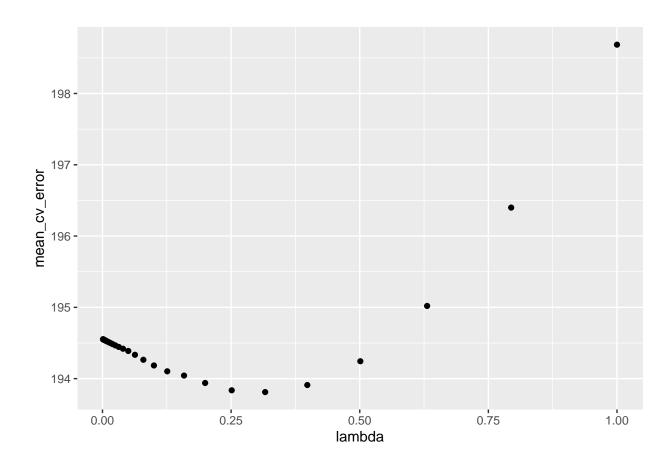

To predict writing score, the adjusted R^2, Cp, and BIC statistics show that a 5-variable model is optimal. The predictors selected are: gender, ethnic_group, parent_educ, lunch_type, test_prep

Limitation: noting that the plots maximum and minimum are not that obvious.

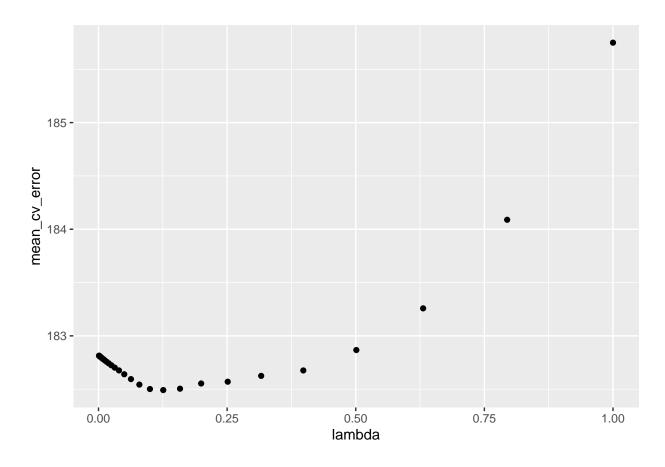

LASSO approach -

Maths score:

Cross Validation

Here are the summary of all the models that have been created in this project.

We will be performing cross validation to select the best model resulted from the models above.

subject	method	(Intercept)	gender	ethnic_group	parent_educ	lunch_type	test_prep	parent_marital_statusX	practice_sport	is_first_child	nr_siblings	transport_means	wkly_study_hours

Method from the lecture code

Method using crossv_mc

Notice how practice_sport and transport_means are not selected in any of the model selections methods. This will be reported at the effect modifier section.

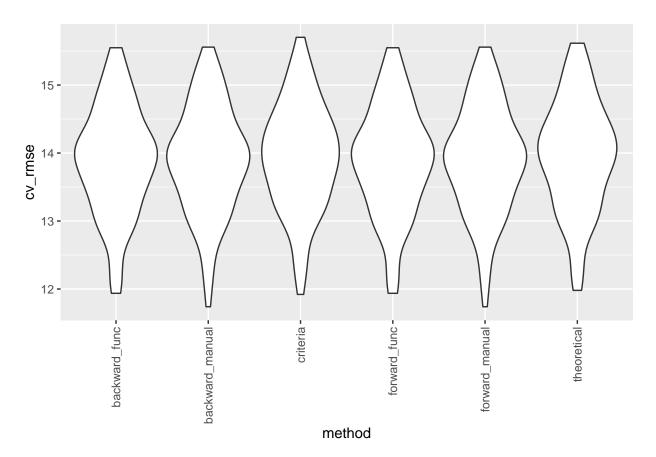

Cross Validation - Math

Method from the lecture codes

method	RMSE
theoretical	13.96975
backward_manual	13.82973
backward_func	13.84664
forward_manual	13.88238
forward_func	13.89506
criteria	13.9035

The model with the best RMSE for Math is math_score \sim gender + ethnic_group + parent_educ + lunch_type + test_prep + wkly_study_hours, which uses backward_manual as a method of approach.

$Method\ using\ crossv_mc$

411	
method	average_rmse
backward_func	13.88519
backward_manual	13.89653
criteria	13.94264
forward_func	13.88519
forward_manual	13.89653
theoretical	13.96494

We noticed that the best model is the one that uses forward elimination with one line code and backward elimination with one line code. The model is math_score \sim lunch_type + ethnic_group + test_prep + gender + parent_educ + wkly_study_hours + nr_siblings

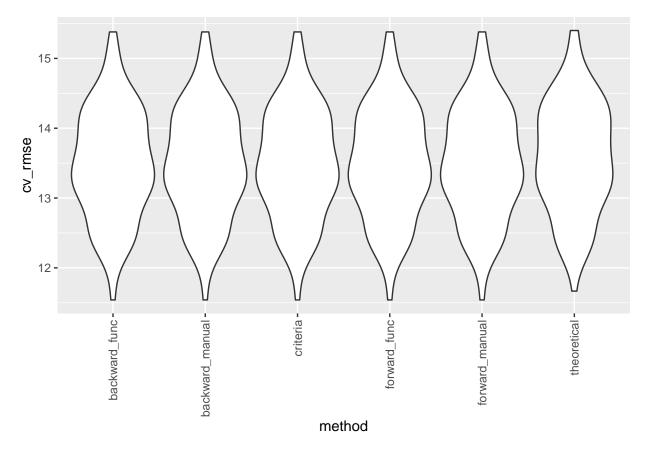

Cross Validation - Reading

Method from the lecture codes

forward_manual	13.42892
forward_func	13.40176
criteria	13.53827

The model with the best MSE for Reading is reading_score \sim lunch_type + gender + test_prep + parent_educ + ethnic_group, which uses forward_func as a method of approach.

Method using crossv_mc

method	average_rmse
backward_func	13.49136
backward_manual	13.49136
criteria	13.49136
forward_func	13.49136
forward_manual	13.49136
theoretical	13.57974

We noticed that the best model is the model that is picked by forward and backward elimination method and criterion based approach. The model is reading_score \sim lunch_type + gender + test_prep + parent_educ + ethnic_group

Cross Validation - Writing

Method from the lecture codes

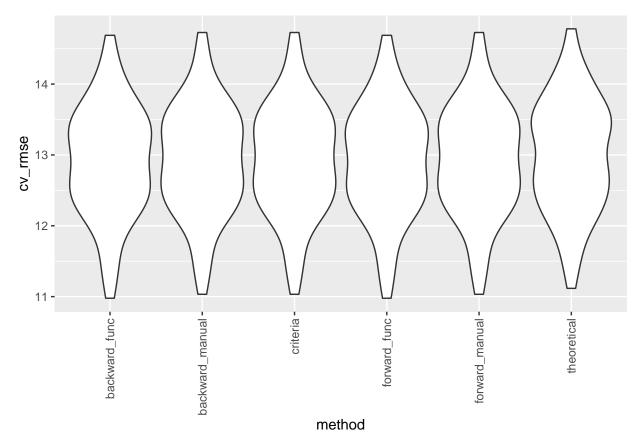

method	RMSE
theoretical	12.95331
backward_manual	12.93239
backward_func	12.90413
forward_manual	12.88047
forward_func	12.90165
criteria	12.9846

Table 1: Math: Effect Modifiers

term	df	sumsq	meansq	statistic	p.value
gender:parent_educ:wkly_study_hours	1	1013.717	1013.717	6.018977	0.0144781

The model with the best RMSE for Writing is writing_score \sim gender + lunch_type + test_prep + parent_educ + ethnic_group, which uses forward_manual as a method of approach.

$Method\ using\ crossv_mc$

method	average_rmse
backward_func	12.91828
backward_manual	12.92630
criteria	12.92630
forward_func	12.91828
forward_manual	12.92630
theoretical	12.99816

We noticed that the best model is the one that uses forward elimination with one line code and backward elimination with one line code. The model is writing_score \sim gender + lunch_type + test_prep + parent_educ + ethnic_group + wkly_study_hours

Table 2: Math: Effect Modifiers

Confounder

Confounding - Math

Removing test_prep will increase $wkly_study_hours$ by 0.0288184. Therefore test prep could be a confounder for weekly study hours in hours

Confounding - Reading

We don't have any confounders for reading score

wkly_study_hours	0.9240399	0.8607815	1.073489	0.2834972

Confounding - Writing

As we can see, removing gender will lower wkly_study_hours by 0.2142857, removing test_prep will increase wkly_study_hours by 0.5238095, and removing parent_educ will lower wkly_study_hours by 0.1573129.

Hence, gender, test_prep, parent_educ could be potential confounder for wkly_study_hours

Final model

Check Assumptions

Math

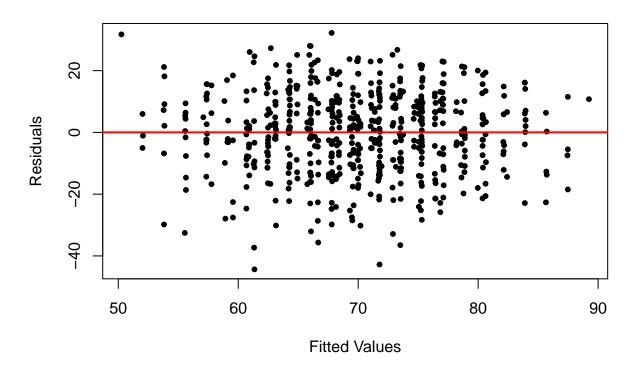

Fitted Values vs Residuals

The residuals show no pattern when plotted against independent variables indicates the relationship between the independent variables and the dependent variable is linear. Also, the residuals are independent of each other. The variance of errors is also constant. These attributes ensure the reliability and validity of the predictive model.

```

The math, reading, writing model explain 26.8%, 22.0%, 31.2% of the score's variance respectively, with a RMSE of 13.7, 13.4, 12.9 and a MAE of 11.1, 10.9, 10.4. These models have an average absolute difference 11.2, 10.9, 10.4 between true score and predicted score. Overall, these three multiple linear regression model indicates a reasonably good fit and predictive accuracy.

Leverage one score

Effect of adding Writing, Reading scores on Maths model

Effect of adding Maths, Writing scores on Reading model

Effect of adding Maths, Reading scores on Writing model

Combined table

model_name	MSE
maths_reading+writing	31.67574
maths_original	187.71873
reading_maths+writing	16.36549
reading_original	177.64685
writing_maths+reading	12.79564
writing_original	163.35751

We can see that the MSE all significantly decreased after adding other scores to fit one score's model, indicating that leveraging other scores to enhance one score's model is possible and successful.

Test potential overfitting issue - maths example

[1] "MSE on Test Set: 31.2708965516677"

[1] "Mean MSE across Folds: 32.5279607340191"

The model performs as well on test set and also across folds. Adding other scores to one score's best fit model did enhance the model.
